

GDPS METRO GLOBAL – LAB: DISASTER RECOVERY VALIDATION USING RS2 DISK

Disaster Recovery validation test

- using RS2 disks in RegB
- Starting configuration

Disaster Recovery Validation Test

- using RS2 disk in RegB

- Purpose

- Check and verify infrastructure in the recovery region
- Validate usability of recovered data

- High level steps

- Capture a practice copy on the RS2 disks in the recovery region

- Used scripts:

- Control script with MGM4SITE_TESTCOPY_CAPTURE
- Control script to bring up sysplex and system in RegB

- Additional consideration

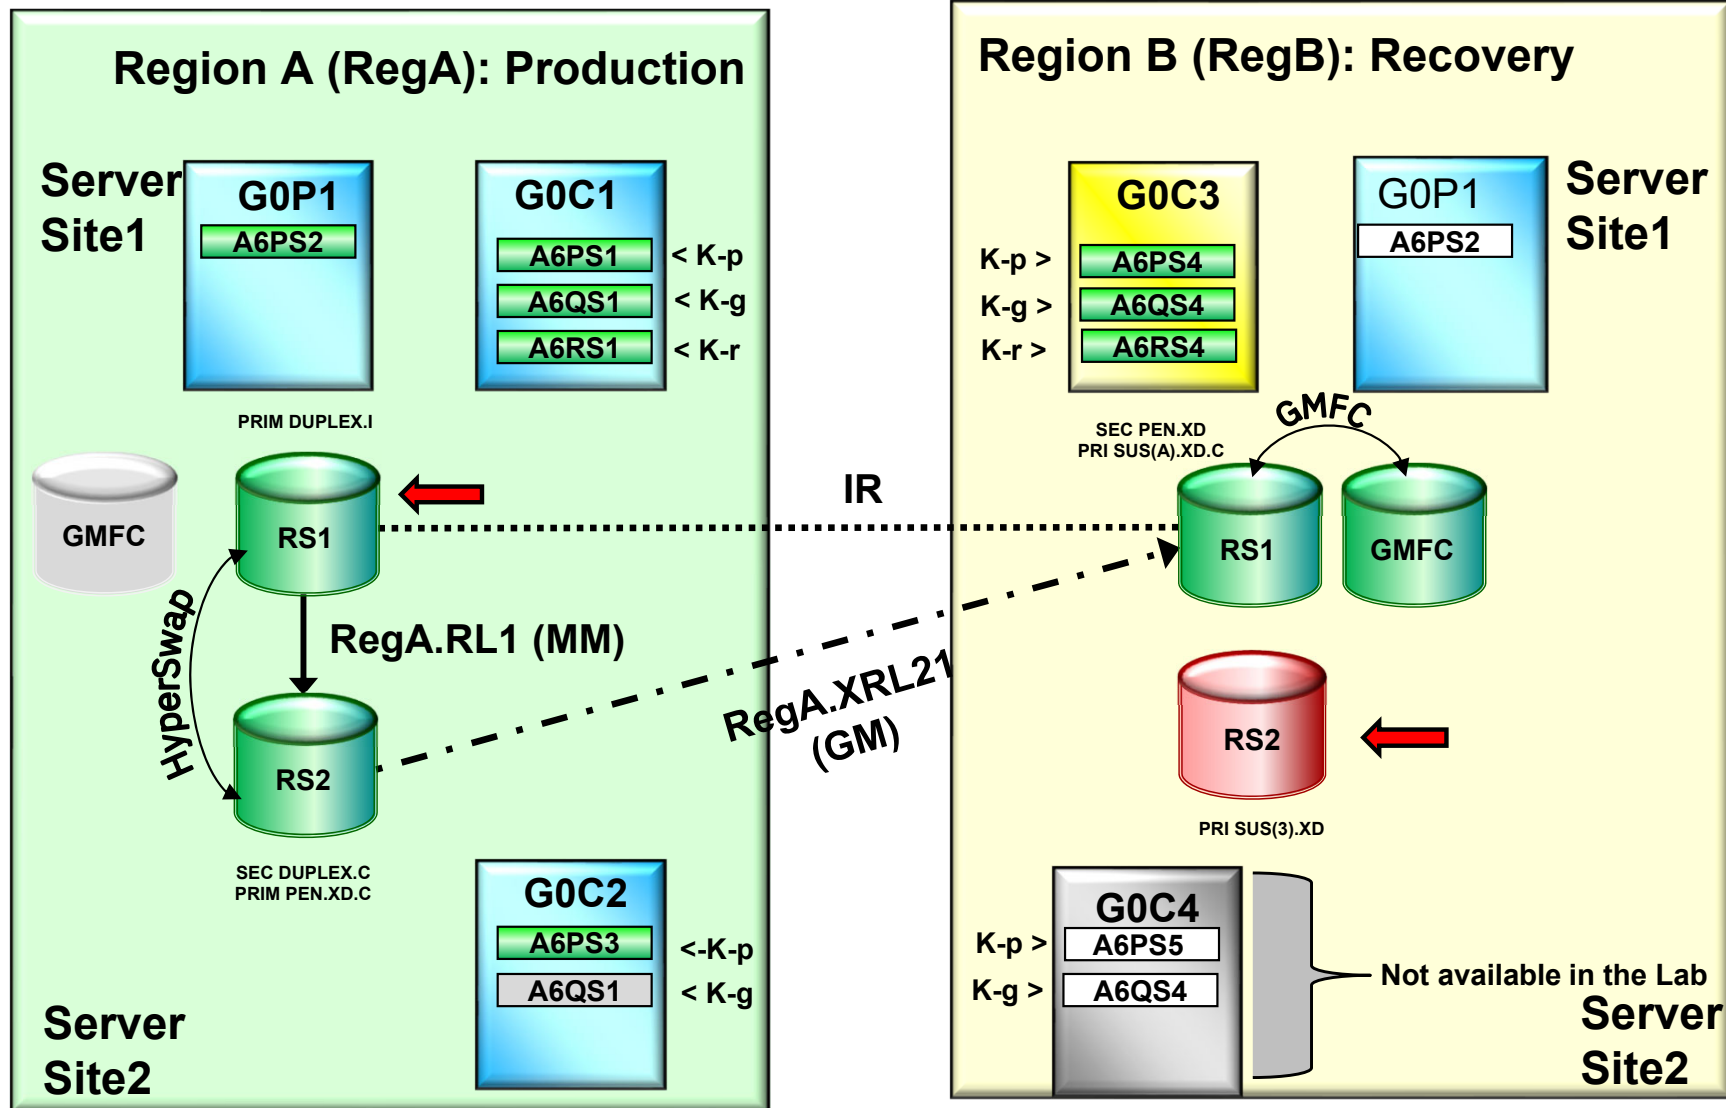

- GOP1 should be brought up into an isolated environment
- DR will briefly age during RS2 preparation

- Restrictions

- Procedure can only be executed in a fully operational cascaded MGM4SITE configuration
- Not supported when in a Multi-Target configuration

Disaster Recovery Validation test

- using RS2 disks in RegB
- Target configuration

Disaster Recovery Validation Test return to normal

- using RS2 disk in RegB

- High level steps
 - Shutdown systems and reset LPARs in advance
 - Execute Procedure to return RS2 to normal
- Used scripts:
 - Control script with MGM4SITE_TESTCOPY_END
 - Control script to stop and deactivate system in RegB

END OF LECTURE
